

Puppy Milk 90 g | 90 g

Ersatzmilch bei Ausfall des Muttertieres, bei zu großen Würfen und zur Versorgung von Handaufzuchten - von Züchtern empfohlen

Product number 635

Weight 0.119kg

Product description

Milk replacer complementary feed for dogs and rodents

Replacement milk in case of failure of the dam

Particularly gentle spray-dried powder from milk in combination with a high proportion of high-quality colostrum are used as the basis for **Puppy Milk**. Due to this composition, it is best adapted to the mother's milk and is also highly digestible for motherless puppies. **Puppy Milk** is free from any synthetic additives.

Puppy Milk can be fed as a replacement milk when the dam is absent, e.g. due to death or illness. For the first 3-4 weeks of life, puppies should be able to manage on their mother's milk alone. In case of milk shortage or large litters, the use of replacement milk can protect the puppies from malnutrition.

Puppy Milk is adapted to a digestion of the puppies remaining stably, additionally contains the necessary defense components, is particularly high-quality and easily digestible. Your pet needs sufficient time to get used to the new food. To avoid digestive disorders, the change of food should be done slowly and gradually.

Stimulate the puppy's belly with a soft, body-warm cloth to stimulate digestion. Until 3 weeks of age, puppies are unable to urinate or defecate on their own. Normally, the bitch stimulates the puppies' digestion by licking their bellies, so it is beneficial to imitate this behavior of the bitch after each bottle and stimulate the little belly. This prevents possible constipation.

Expert tip: Additional puppy milk is superfluous if the dam is healthy and gives enough milk. We recommend **Fit-Crock Puppy Lamb** as an early supplementary feeding and subsequently as a complete feed. It is moistened with water at the beginning of the puppy feeding, crushed, and fed as a mash.

Please consider the feeding recommendation only as a guideline for a balanced, needs-based diet for your puppies. These figures have been calculated according to the latest scientific knowledge, but it is essential to adapt them to the individual needs of your puppies. Because one single figure cannot possibly do justice to all individual differences and conditions such as breed, age and size of the puppies, exercise performance, environmental influences (weather, summer, winter), etc.

EMERGENCY SET: 90 g. In order to be prepared for emergencies, we recommend that owners of gestating bitches always have **cdVet Puppy Milk** and **singulares Colostrum** in stock!

You can find more tips on feeding here: www.cdvet.eu/Download/Welpenmilch_Fütterungsempfehlung.pdf

Composition: whole-milk powder, colostrum, milk protein, sodium chloride, locust bean gum

Analytical constituents and levels: crude protein 29.42%, crude fat 22.62%, crude fiber 0.01%, ash 6.27%

Feeding recommendation: mix 1 part **Puppy Milk** with 3 parts hot, no longer boiling water and allow to cool to feeding temperature. Feeding amount: approx. 15-25 ml per 100 g puppy weight per day. The daily amount is divided into 6-10 rations in the first week, later decreasing to 4 feedings per day. Feeding amount may vary by breed and nutritional condition of the puppy.

Contains high-quality colostrum!

Product properties

Composition	Sodium chloride, Colostrum, Milk, Currant
Feed Profile	Grain-free, Minerals / trace elements, Feeding, Vitamins, Without additives, Leisure, Breeding
Animal categories	Rodents, Dogs
Phase of life	Juniors
Product type	Supplementary feed
Product form	Powders
Special Requirements	Intestines, Milk shortage, Puppy rearing, Immune system
