EquiGreen AcceptanceMix 2.5 kg | 2,5 kg

Manufacturer	EquiGreen
Product number	1687
Weight	2.5kg
Length	200mm
Width	200mm
Height	205mm

Product description

Metabolism and digestive system of horses, ponies, and donkeys are designed for the continuous intake of feed that is rich in raw fibres, low in energy and protein. Only through breeding of larger, heavy animals for work in the field, in front of the carriage, and under the rider, the feeding of grain as concentrate became necessary. However, the digestive system is actually not designed for such concentrate. The metabolism may also have problems processing these nutrients. This is especially the case with frugal, robust breeds of horses, as well as ponies and donkeys, in whose area of origin not much grain is available for feeding horses.

Therefore, it is often problematic to feed these animals with complementary feed, as the usual concentrate and muesli feed contains cereals and is usually not good for them. But how then how to balance their often increased need for micronutrients? Sea minerals are essential for ponies that originally came from islands. Many North American horse breeds are attuned to the presence of mineral complexes in the soil, which are lacking in our country. Also otherwise, intensive agriculture has resulted in a much less species-rich and less diverse feed basis than in the past. This can also lead to deficits in the micronutrient area.

But how can we now feed these important, sometimes less tasty nutrients without burdening the organism with potentially harmful concentrate or muesli food? The answer is EquiGreen AcceptanceMix, a tasty mix of high-quality, purely natural ingredients that is ideal for feeding complementary feed without burdening the metabolism and digestive tract. It is because it contains neither concentrated carbohydrates nor synthetic additives, and can help maintain the health of horses, ponies and donkeys, particularly those that are sensitive to metabolism. Especially for animals suffering from diseases of civilisation (founder, summer eczema, malanders, fecal water) and metabolic disorders (EMS Cushing, PSSM, Pyroluria etc.), which are becoming more and more frequent, the addition of concentrated natural micronutrients is very important, and therefore a feed that supports their intake.
